Electrochemical Synthesis of Propylene Oxide Under Reductive Conditions

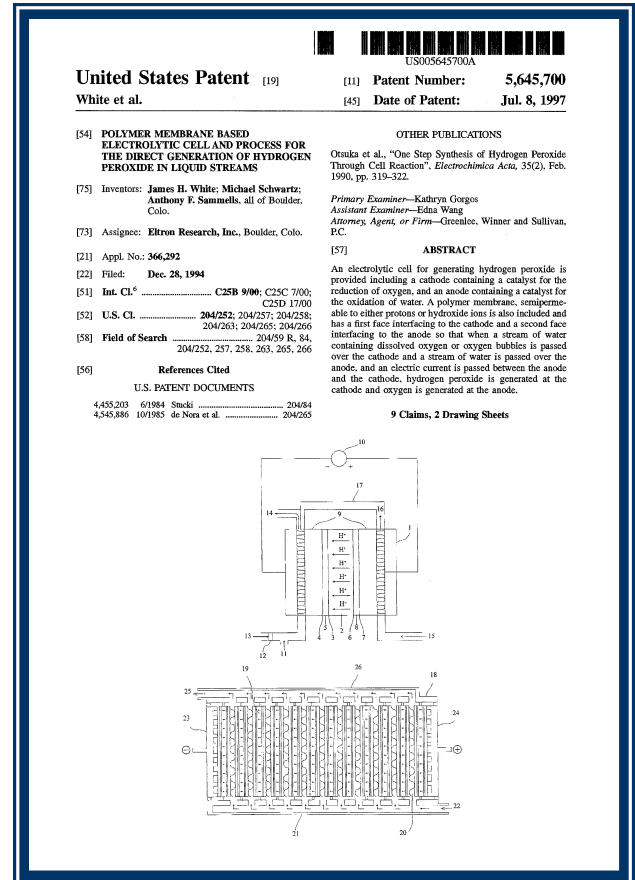

Eltron Research & Development has explored a one-step process for synthesizing propylene oxide from propylene/oxygen mixtures. The technology developed to achieve this employs an electrolytic cell with a bifunctional cathode containing an electrocatalyst for the electrogeneration of hydrogen peroxide and a catalyst for the epoxidation of propylene to propylene oxide.

In Eltron's approach, an electrolytic cell for generating hydrogen peroxide is provided including a cathode containing a catalyst for the reduction of oxygen, and an anode containing a catalyst for the oxidation of water. A polymer membrane, semipermeable to either protons or hydroxide ions, is also included. The membrane has one face interfacing to the cathode and a second face interfacing to the anode; when a stream of water containing dissolved oxygen or oxygen bubbles is passed over the cathode and a stream of water is passed over the anode, and an electric current is passed between the anode and the cathode, hydrogen peroxide is generated at the cathode and oxygen is generated at the anode. The hydrogen peroxide is exposed to a catalyst (titanium silicate) to yield propylene oxide.

The technologies described, and all related inventions are owned by Eltron Research & Development Inc, and protected by copyrights, trademarks, issued and pending patents, trade secrets, or other applicable intellectual property rights.
